NOTILE

Is already used in:

- Schools
- Hospitals
- Hotels
- Day Care Centres
- Bathrooms
- Toilets

Cleaning processes are generally effective at reducing bacteria but the minute the cleaning stops bacteria begins to grow on surfaces – and with it the risk of cross-contamination, illness and infection. NOTILE is a glass-fibre reinforced polyester panel, incorporating the antimicrobial BioCote® within the surface.

NOTILE inhibits the growth of bacteria and fungi, including MRSA and Aspergillus Niger (black mould). The panels are extremely flexible and can be easily fixed to plaster, wood, brick and old tiles to provide hygienic wall coverings and ceilings. They are also virtually maintenance-free.

BioCote® is the market leader in utilising silver technology to provide antimicrobial protection, creating cleaner, safer and more hygienic products. This antimicrobial agent is effective against a broad spectrum of micro-organisms, including MRSA, E-coli, Legionella, Salmonella, Campylobacter, Listeria and Aspergillus Niger (black mould).

Independent testing has proven that BioCote® inhibits the growth of bacteria on surfaces by up to 99.9% over a 24-hour period – and retains its antimicrobial properties for the lifetime of the NOTILE panels, without it wearing off or leaching from the surface.

Introducing NOTILE – a major new line of defence in the fight against infection
